

Check-in calls

CareRinger® started out 10+ years ago with just the check-in calls. Using a timer to automate, one can expect a daily call. If the call is not answered. A designated contact will get a notification. The user will decide what the check-in is about. Typical applications include wellness check, medication reminder etc.

These days, most people have a phone, so we use the phone as the primary means for communication. Some of us are still a landline user, so we include support for the plain old telephone and those that works with the internet (internet phone). The service is language independent because one only has to pick up the phone to let their family or friends know they are well.

Light Buttons

We thought it works better to have a light to show that a call is about to happen (especially for those with difficulty hearing). This is why we include a light button. For early check-in so one doesn't have to wait for the call, the button can signal early check-in just as well.

Call Bell

A button was added to turn the light into a call Bell. When a community in the north asked for a call bell service, the button functions as a call bell to address their need.

Others

Contact us for other developments (e.g. inactivity monitor) using Amazon® products.
